

Task 2: Sales Performance Analysis Report

Objective

The objective of this project was to analyze sales performance using the Superstore Sales dataset. The analysis focused on identifying sales trends, regional performance, product category performance, profitability, and business opportunities through exploratory data analysis and data visualization.

Dataset

Dataset Used: Sample - Superstore

The dataset contains customer order information, including order dates, product categories, regions, sales, profit, discounts, and customer details.

Data Preparation

The dataset was cleaned and prepared before analysis by performing the following steps:

- Removed duplicate records.
 - Converted Order Date and Ship Date into datetime format.
 - Checked for missing values.
 - Created additional columns such as Year, Month, Month Name, Year-Month, and Profit Margin for easier analysis.
-

Key Performance Indicators (KPIs)

The following KPIs were calculated:

- **Total Revenue:** Overall sales generated during the analysis period.
 - **Total Profit:** Overall profit earned from sales.
 - **Profit Margin:** Percentage of profit earned relative to total revenue.
 - **Average Order Value (AOV):** Average revenue generated per customer order.
 - **Conversion Metrics:** Not available because the dataset does not contain customer visit or conversion data.
-

Key Findings

- Sales showed noticeable monthly fluctuations, indicating seasonal demand patterns.

- Profit trends differed from sales trends, suggesting that discounts and product mix significantly influence profitability.
 - Regional analysis highlighted differences in both sales and profit performance, identifying strong and weak markets.
 - Certain product categories contributed significantly more revenue than others.
 - Top-performing products generated a large share of total sales, while several products consistently produced low profits despite being sold.
-

Tactical Improvements for Alfido Tech

1. Increase promotional campaigns for high-performing product categories and best-selling products.
 2. Review pricing and discount strategies for products with consistently low profitability.
 3. Strengthen inventory planning before peak sales periods to meet seasonal demand.
 4. Develop region-specific marketing campaigns to improve sales in underperforming regions.
 5. Implement customer loyalty programs and personalized product recommendations to increase repeat purchases and average order value.
-

Conclusion

The analysis provides valuable insights into business performance across products, categories, regions, and time. By leveraging these insights, Alfido Tech can optimize inventory planning, improve pricing strategies, strengthen regional sales performance, and increase overall profitability. The visualizations and KPIs generated during this project provide a strong foundation for data-driven business decision-making.
